

Yishay Asher & Steve Gutfreund

Project Guide

Preparation

- 1) clone the project from <https://github.com/SimSteve/Project.git>
- 2) make sure you keep the hierarchy of the folders as is (otherwise the imports won't work)
- 3) the working directory should be: C:\<PATH TO THE PROJECT>\Project\
- 4) python version 3.6
- 5) make sure to have the following packages:
 - tensorflow
 - numpy
 - matplotlib
 - pycrypto (OR pycryptodome for WINDOWS, but rename the crypto folder to Crypto)

naming convention

All trained models are being saved according to the following convention:

DATASET_ARCHITECTURE_ENCRYPTION_NORM_PADSIZE

Example:

fashion_modelB_CTR_ONORM_0PADDED

Note: The NORM parameter accepts only two possible values; 0NORM and 0.5NORM. A model you wish to attack with the CW attack, should be trained with 0.5NORM.
(NORM does not affect the accuracy, it just makes a linear shift on all the pixels.)

train a new model

python .\src\trainer.py

```

    [-h] <-d dataset> <-m architecture> [-e encryption] [-p padsize] [-n normalization]
-h          show this help text
-d          specifying the dataset; mnist or fashion <must>
-m          specifying the model architecture; modelA or modelB <must>
-e          specifying the encryption method; UNENCRYPTED, PERMUTATED, ECB, CBC or CTR.
            default is UNENCRYPTED [optional]
-p          specifying the number of rows to pad, default is 0 [optional]
-n          specifying the normalization (img / 255.0 - n), default is 0 [optional]

```

Example:

python .\src\trainer.py -d fashion -m modelB -e CTR

predicting an image

python .\src\predictor.py [-h] <-f filename> [-i index]

```

-h          show this help text
-f          specifying the filename of the model <must>
-i          specifying the index, if non specified than randomly chosen [optional]

```

Example:

python .\src\predictor.py fashion_modelB_ECB_0NORM_PADDED
-f mnist_modelB_CTR_ONORM_0PADDED -i 613

evaluate model

```
python .\src\evaluation.py [-h] <-f filename> [-n amount]
```

- h show this help text
- f specifying the filename of the model <must>
- n specifying the amount of images, default is 10000 [optional]

Example:

```
python .\src\evaluation.py -f mnist_modelA_PERMUTATED_0.5NORM_32PADDED -n 1000
```

plot a collage of encrypted images

```
python .\src\collage_of_encrypted_images.py
```

```
[-h] <-d dataset> <-e encryption> [-p padsize] [-c classes] [-i images]
```

- h show this help text
- d specifying the dataset; mnist or fashion <must>
- e specifying the encryption method; PERMUTATED, ECB, CBC or CTR <must>
- p specifying the number of rows to pad, default is 0 [optional]
- c specifying the number of classes, default is 10 [optional]
- i specifying the number images for each class, default is 10 [optional]

Example:

```
python .\src\collage_of_encrypted_images.py -d mnist -e PERMUTATED
```

visualize an attack

```
python .\src\visualize_attack.py [-h] <-f filename> [-i index] [-c CW_mode]
```

- h show this help text
- f specifying the filename of the model <must>
- i specifying the index, if non specified than randomly chosen [optional]
- c specifying carlini mode; 2,0 or i. default is 2 [optional]

Example:

```
python .\src\visualize_attack.py -f fashion_modelA_CTR_0.5NORM_0PADDED
```

attacking a dataset

```
python .\src\dataset_attack.py [-h] <-f filename> [-i amount] [-c CW_mode]
```

- h show this help text
- f specifying the filename of the model <must>
- i specifying the amount, default is 1000 [optional]
- c specifying carlini mode; 2,0 or i. default is 2 [optional]

Example:

```
python .\src\dataset_attack.py mnist_modelB_PERMUTATED_0NORM_0PADDED
```
