DEFENSE AGAINST ADVERSARIAL EXAMPLES

Yishay Asher • Steve Gutfreund Supervisor: Hanan Rosemarin

Problem Description

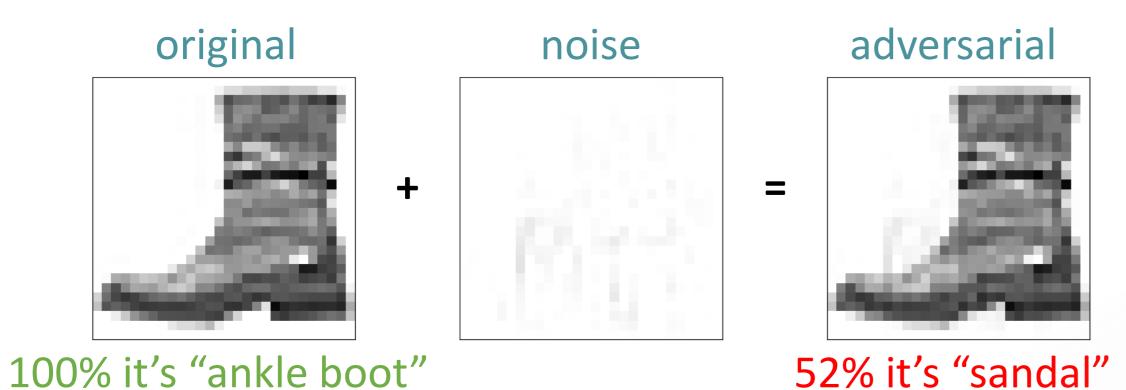

Building high accuracy DNN models which are sufficiently resistant to adversarial attacks

בס"ד

Background and Goal

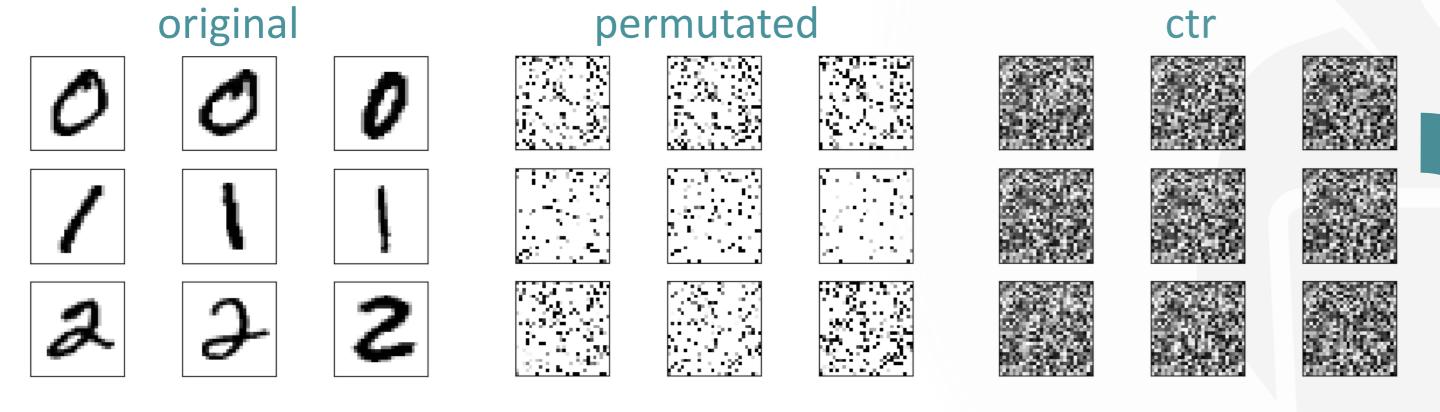

- An adversarial example is an instance with small, intentional feature perturbations that causes a machine learning model to make a false prediction.
- The goal is to find a way to train 'secured' models such that this sort of attacks should not affect them.
- Project based on the article Bridging machine learning and cryptography in defense against adversarial attacks

example of an adversarial image

3 Cutting Loose Ends

Eliminated the models that did not learn well. Learning encrypted images is not very intuitive, as can seen below.

sample of the encrypted images.

Results

There's a slight tradeoff between accuracy on the original images and the accuracy on the adversarials, but overall, accuracies are good

	model	images	unencrypted	Permutated	aes · ecb	aes · cbc	aes · ctr
2011111	A	originals	1.49	3.70	18.40	67.60	3.70
		cw l_2	100.00	4.50			4.20
		cw l_0	100.00	7.30			9.60
		cw l_{∞}	100.00	5.40			4.90
	В	originals	2.10	4.20	19.30	87.40	2.70
		fgsm	39.50	8.60			4.90

	model	images	unencrypted	permutated	aes · ecb	aes · cbc	aes · ctr
-mnist	A	originals	8.30	12.30	54.60	71.50	17.40
		$cw\ l_2$	100.00	12.70			17.20
I-UOI		cw l_0	100.00	12.50			18.70
rasni		cw l_{∞}	100.00	12.90			17.80
	В	originals	9.50	12.00	55.30	90.30	16.70
		fgsm	77.20	29.80			26.50

classification error (%) on the first 1000 test samples

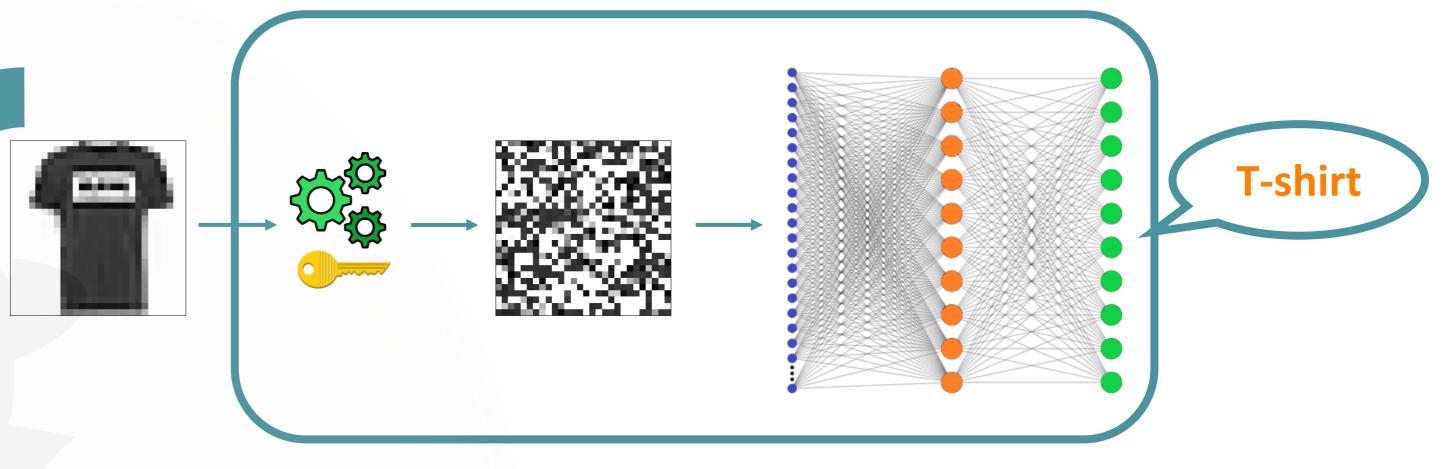

Set-Up

- Mnist and Fashion-Mnist datasets
- Using well-known neural nets
- Training 'unsecured' models

Securing Models

Approach: training models on encrypted images. Encryption techniques:

- Permutation
- AES in ECB, CBC and CTR modes

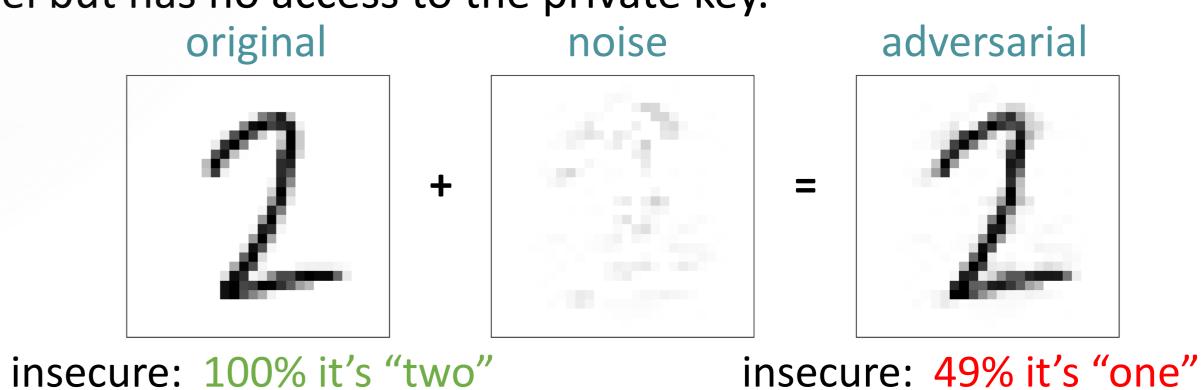

architecture for securing models

Attacking

Attacks:

- Carlini & Wagner, CW
- Fast Gradient Sign Method, FGSM

'gray-box' scenario, i.e. the attacker knows the architecture of the model but has no access to the private key.

100% it's "two" 100% it's "two" secure: secure:

visualization of a CW attack secured by permutation

Success with Permutation, Coincidence?

To verify the learning ability of a permutation model does not result from high density in small images, we trained models on padded images.

		image size	error rate
		28x28	3.70
	mnist	40x40	3.40
		60x60	3.30
	fools: os	28x28	12.30
	fashion mnist	40x40	14.40
		60x60	10.80

results for training permutated data, various image dimensions

Future Work

Nicholas Carlini ('C' in CW) Improve accuracy on AES-ECB believes that CW might still model defeat these defenses

Test on more complicated datasets; i.e. Cifar-10
