# DEFENCE AGAINST ADVERSARIAL EXAMPLES

Yishay Asher • Steve Gutfreund Instructor: Hanan Rosemarin

#### **Problem Description**

Building high accuracy DNN models which are sufficiently resistant to adversarial attacks

# **Background and Goal**

- ✓ An adversarial example is an instance with small, intentional feature perturbations that cause a machine learning model to make a false prediction.
- ✓ The goal is to Find a way to train 'secured' models such that this sort of attacks should not affect them.
- ✓ Project based on the article <u>Bridging machine learning and cryptography in defence against adversarial attacks</u>

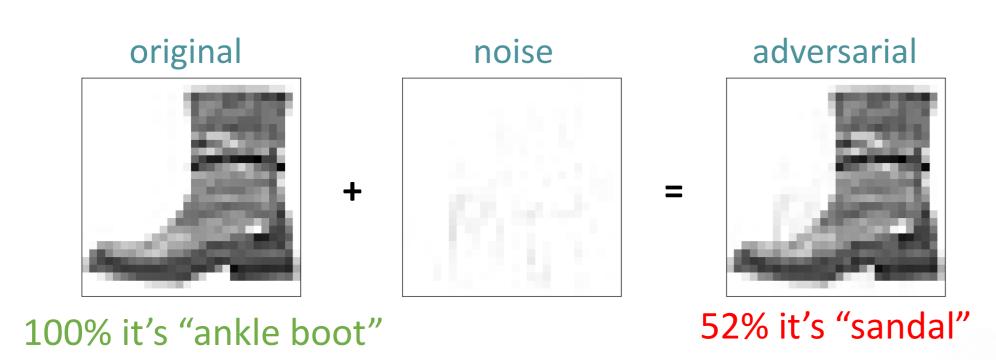

Figure 1: example of an adversarial image

# Set-Up

- ✓ Mnist and Fashion-Mnist datasets
- ✓ Using well-known neural nets

# 1. Securing Models

Approach: training models on encrypted images. Encryption techniques:

- ✓ Permutation
- ✓ AES in ECB, CBC and CTR modes

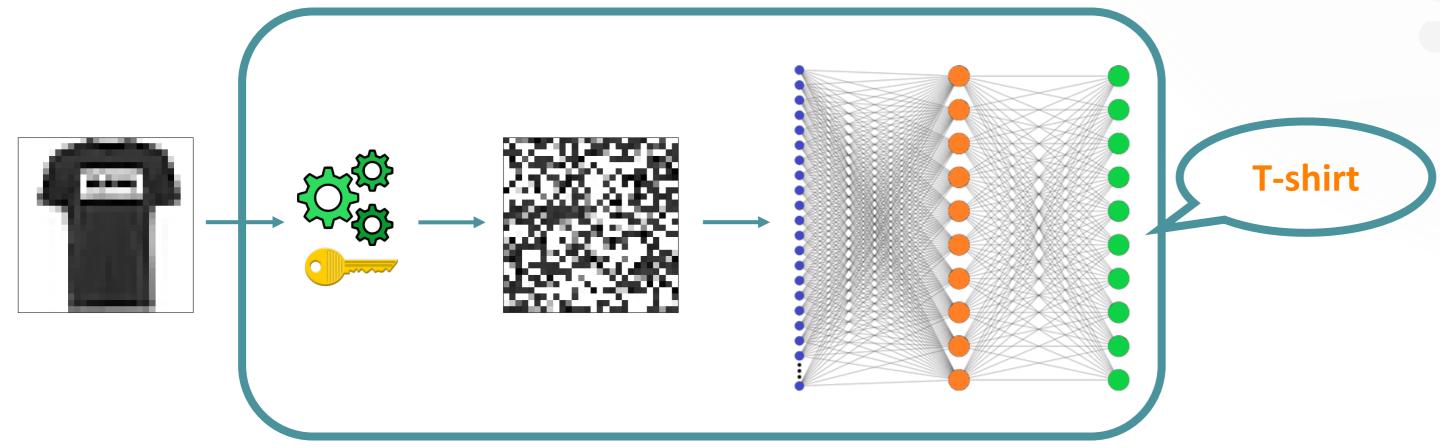

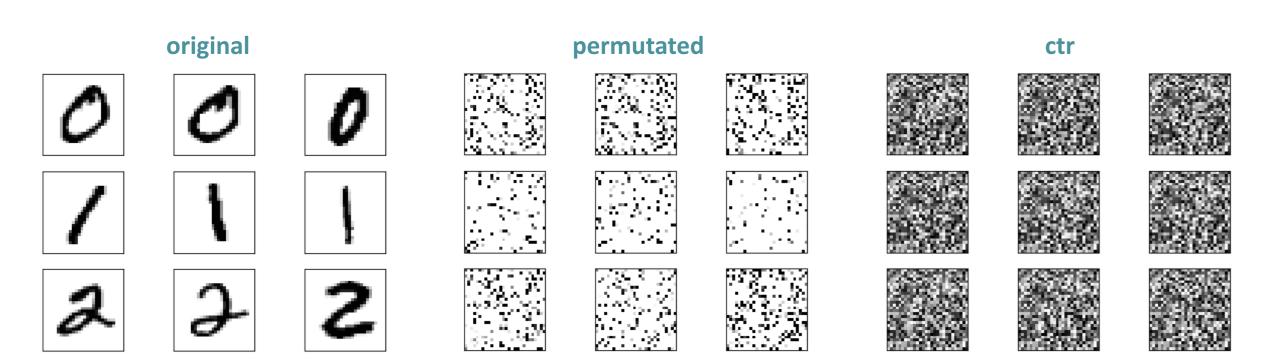

Figure 2: architecture for securing models

## 2. Cutting Loose Ends

Eliminated the models that did not learn well. Learning encrypted images is not very intuitive, as can be seen in figure 3.

**Figure 3:** Sample of the encrypted images. Interesting to see how for the human eye it's difficult to distinguish between various classes but a DNN model classifies quite well, as can be seen in table 1

# 3. Attacking

#### Attacks:

- ✓ Carlini & Wagner, CW
- ✓ Fast Gradient Sign Method, FGSM

'gray-box' scenario, i.e. the attacker knows the architecture of the model but has no access to the private key.

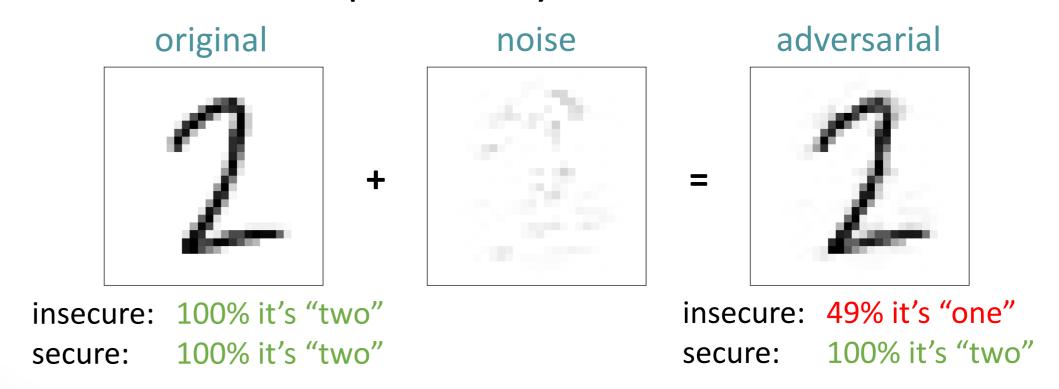

Figure 4: visualization of a CW attack secured by permutation

#### Results

There's a slight tradeoff between accuracy on the original images and the accuracy on the adversarial images, but overall, accuracies are good

Classification error (%) on the first 1000 test samples							
			mnist		fashion mnist		
	model		original adversarial images		original adversar		rial images
		images	attack		images	attack	
UNENCRYPTED	A	1.49	$CW\ l_2$	100.00	8.30	$CW\ l_2$	100.00
			$CW\ l_0$	100.00		$CW\ l_0$	100.00
			CW $l_{\infty}$	100.00		CW $l_{\infty}$	100.00
	В	2.10	FGSM	39.50	9.50	FGSM	77.20
PERMUTATED	Α	3.70	$CW\ l_2$	4.50	12.30	$CW\ l_2$	12.70
			$CW\ l_0$	7.30		$CW\ l_0$	12.50
			CW $l_{\infty}$	5.40		CW $l_{\infty}$	12.90
	В	4.20	FGSM	8.60	12.00	FGSM	29.80
AES · ECB	Α	18.40	$CW\ l_2$	irrelevant	54.60	$CW\ l_2$	irrelevant
	В	19.30	FGSM		55.30	FGSM	
AES · CBC	Α	67.60	$CW\ l_2$	irrelevant	71.50	$CW\ l_2$	irrelevant
	В	87.40	FGSM		90.30	FGSM	
AES · CTR	Α	3.70	$CW\ l_2$	4.20	17.40	CW l <sub>2</sub>	17.20
	В	2.70	FGSM	4.90	16.70	FGSM	26.50

Table 1: table containing all the results

## Success with Permutation, Coincidence?

To verify that the learning ability of a permutation model does not result from high density in small images, we trained models on padded images. Padding done with white pixels. See table 2 for results.

	image size	error rate			
	28x28	3.70			
mnist	40x40	3.40			
	60x60	3.30			
	28x28	12.30			
fashion mnist	40x40	14.40			
	60x60	10.80			

Table 2: results for training permutated data, various image dimensions

# **Future Work**

- ✓ Improve accuracy on AES-ECB model
- ✓ Nicholas Carlini (the 'C' in CW attack) believes we still might defeat these defenses. (we contacted him)
- ✓ Test on more complicated datasets; i.e. Cifar-10
